

Pulse: proposal for Al Das Medical

Oct 10, 2026 · @System Novalux

Pulse replaces Sanoflow, the Airtable back office and the Make.com automations with one platform owned by Al Das, and is built and tested; the next step is a guided demo and a one-number pilot.

Why Pulse

Today a patient's journey crosses three tools that do not share data: Sanoflow for WhatsApp (about 38,700 contacts, three numbers), Airtable and Make.com for the back office (five bases and 49 automation scenarios, seven of them live), and the Unite EMR as the record of visits and invoices.

Every handover between tools is a place where a message, a reminder or a follow-up can be lost, and the credentials that connect them sit in plain text inside the automations. Pulse puts the inbox, patient records, appointments, campaigns, automations, back office and finance in one system that Al Das owns and controls.

What Pulse delivers

Eight modules are built, each replacing something Al Das uses today.

Module	What staff can do	Replaces
Shared inbox	Reply to WhatsApp in English or Arabic, assign, add internal notes, see delivery ticks, get AI-drafted replies to review	Sanoflow inbox
Patients	One record per person, segments, duplicate merge, consent and opt-out flags, import from Sanoflow and Airtable	Sanoflow contacts, Airtable patient tables
Appointments	Diary with doctor and service slots, reminders with Confirm, Reschedule and Cancel buttons, read-only sync from Unite	Sanoflow appointments, Make reminder scenarios

Module	What staff can do	Replaces
Campaigns and templates	26 starter templates (13 messages in English and Arabic), audiences, paced sending, results with retries	Sanoflow campaigns and templates
Flows and recall	Visual bots with 21 step types, birthday and 90-day chronic-care recall, human takeover	Sanoflow flows, Make birthday and recall scenarios
Back office	Reference data, follow-up queue, clinical settings with sign-off history	Airtable portal screens
Reports	Management and team dashboards, CSV export	Airtable dashboards
Finance and insurance	Invoice capture, claim matching, ten exception rules, monthly summary	Manual spreadsheet checks

Where it stands today

The full build is complete: 59 screens, 126 database tables and 1,245 automated tests passing. It has been exercised against simulated WhatsApp, Unite and AI services, not against Al Das's live accounts.

That is the honest status: feature-complete, not yet proven live. The next step is to connect Al Das's own accounts, click through every screen as reception, finance and administrator roles on a real system, and run a one-number pilot. Patient-facing clinical messages stay switched off until the clinical lead signs off the thresholds.

Safety and compliance

Patient data is health data, and the platform is built on that assumption. Each of these rules is enforced by an automated test.

- Every table is scoped to the organisation, and tests prove one organisation cannot read another's rows.
- Access is by role: 40 permissions, so reception cannot open finance or settings.
- The Activity log records who changed roles, access, channels, imports and exports. Entries cannot be edited.

- WhatsApp and Unite credentials are encrypted at rest; tokens and phone numbers never appear in logs.
- Unite is read-only: Pulse never writes to the EMR, uses conservative rate limits and stops itself after repeated failures.
- AI answers only clinic questions, only as drafts for staff, never diagnoses or advises on dosing, and a person can take over in one click.
- Marketing messages honour opt-outs, and WhatsApp's 24-hour rule is enforced in the composer.

Two decisions remain with Al Das and its advisers: where patient data may be hosted under UAE health-data rules, and whether conversation text may be sent to the AI provider. Neither is assumed; AI stays off until both are answered.

Training and recordings

Reception learns Pulse from recorded walkthroughs of the real product, not from a manual. The clips are generated from scripted scenarios on a practice clinic with synthetic patients, so when a screen changes the clip is re-recorded with one command.

- Twelve clips of three to five minutes for reception, in English and Arabic: install on the phone, your day at a glance, inbox basics, the 24-hour rule, booking and moving appointments, reminder replies, call tasks, walk-ins and families, merging duplicates, failed messages, end-of-day checklist, privacy rules.
- A help button on every page opens the matching clip and a one-page guide.
- A training mode with a visible banner lets staff practise with no real patients and no real messages.
- Shorter sets follow for managers, finance and administrators.
- Front-desk champions review each clip before it is released.

Rollout

Nothing is switched off until its replacement has run side by side with it.

1. Rehearse on a staging system: preflight checks, a load test, and a dry run of the data import with a reconciliation report.
2. Run in parallel for one week: Pulse and the Make automations side by side in test mode, with a daily comparison.
3. Cut over WhatsApp numbers one at a time, quietest first, keeping Sanoflow subscribed until the third number is stable.

4. Retire Make, then Airtable, then Sanoflow; revoke the migration keys and rotate the Unite credentials.

The pilot and the first two steps can run before any patient-facing clinical message is enabled.

Running costs

Planning ranges for the platform are \$75 to \$400 a month in total; these are estimates, not quotes. WhatsApp conversation fees are paid by Al Das to Meta exactly as today.

Item	Estimate, USD per month
Supabase (database, sign-in, storage)	25 to 150
Vercel (hosting)	20 to 60
AI usage (Anthropic)	30 to 150
E-mail, monitoring, other	0 to 40
Sanoflow, Airtable and Make.com subscriptions replaced	To be confirmed from current invoices

Open question: send the last three months of Sanoflow, Airtable and Make invoices so the saving can be stated as a number.

What we need and next steps

The longest lead times are the WhatsApp account confirmation and the data-hosting opinion, so those start first.

Need	Owner
Confirm Al Das owns the WhatsApp Business Account	Saeed
Legal view on patient-data hosting and on AI processing	Management
Sign-off of clinical thresholds (recall interval, red-flag scores)	Abdul and Snezana
New Unite credentials and a token test with the existing automations	Sharaf and Unite

Need	Owner
Two or three front-desk champions for testing and training clips	Operations

Next steps: agree a demo date, run the guided demo on the practice clinic, then choose the pilot number. Demo date, pilot number and decision owner to be confirmed.
